

4WE Solenoid Operated Directional Valve

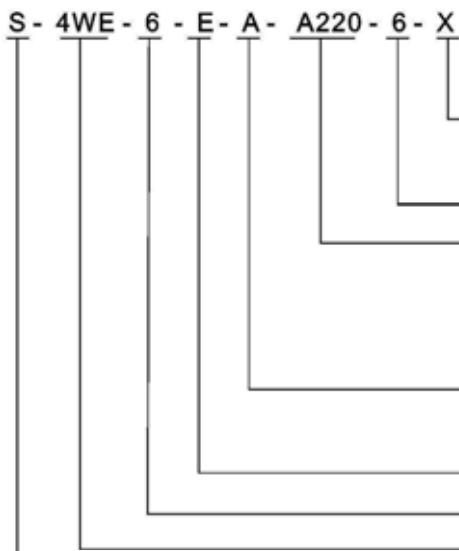

Essentially the direction control valves consist of housing, one or two solenoids, the control spool, and one or two return springs. In the de-energised condition the control spool is held in neutral or initial position by means of return springs (except for impulse spool). The control spool is operated by wet pin solenoids. The force of the solenoid acts via the plunger on the control spool and pushes this from its neutral position to the required end position. This gives free flow from P to A or P to B and A to T. When solenoid is de-energised, the control spool is returned to its neutral position by means of return springs. To guarantee satisfactory operation care should be ensure that the solenoid pressure chamber is filled with oil. Solenoid operated direction valves are control the start, stop, and direction of flow. And they also be used as pilot valves to operate other valves and so on.

Characteristics:

- 1.Optional hand emergency;
- 2.Solenoid coil can be rotated through 90° ;
- 3.Coils can be replaced without releasing any fluid.

Model Code

The solenoids type: X=the iron shell

Y=the plastic shell

Series: 60to69

A220=A220V/50Hz&A240V/60Hz

A110=A110V/50Hz&A120V/60Hz

D24=24V

D12=12V

A:Plug-in connection

B: with lamp central connection

Symbol: (See below)

Size: 6=6 10=10

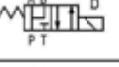

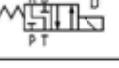

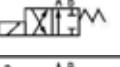

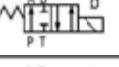

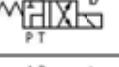

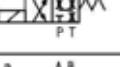

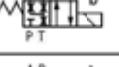

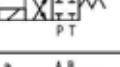

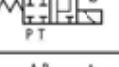

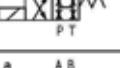

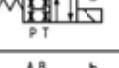

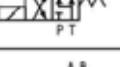

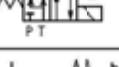

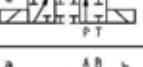

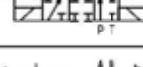

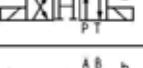

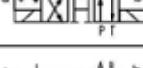

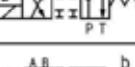

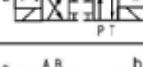

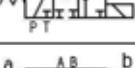

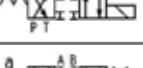

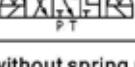

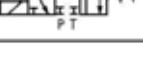

4WE: Solenoid Operated Directional Valve

S: Hydraulic Cushion

No code:Standard

*We can produce special need types: Please contact with us

The switching power limits given are for featuring two flow directions (e.g. from P to A and simultaneous return flow from B to T). Due to the flow forces active within the valves the permitted power limit directional valves may be considerably less where there is only one direction of flow (e.g. from P to A and port B blocked). The power limit for directional valves was determined using solenoids at their operating temperature, 10% under voltage and with no pre-loading of the tank.

(1)With hand emergency.
